this is a monograph covering topological fixed point theory for several classes of single and

multivalued maps the authors begin by presenting basic notions in locally convex topological vector spaces special attention is then devoted to weak compactness in particular to the theorems of eberlein mulian grothendick and dunford pettis leray schauder alternatives and eigenvalue problems for decomposable single valued nonlinear weakly compact operators in dunford pettis spaces are considered in addition to some variants of schauder krasnoselskii sadovskii and leray schauder type fixed point theorems for different classes of weakly sequentially continuous operators on general banach spaces the authors then proceed with an examination of sadovskii furi pera and krasnoselskii fixed point theorems and nonlinear leray schauder alternatives in the framework of weak topologies and involving multivalued mappings with weakly sequentially closed graph these results are formulated in terms of axiomatic measures of weak noncompactness the authors continue to present some fixed point theorems in a nonempty closed convex of any banach algebras or banach algebras satisfying a sequential condition p for the sum and the product of nonlinear weakly sequentially continuous operators and illustrate the theory by considering functional integral and partial differential equations the existence of fixed points nonlinear leray schauder alternatives for different classes of nonlinear ws compact operators weakly condensing 1 set weakly contractive strictly quasi bounded defined on an unbounded closed convex subset of a banach space are also discussed the authors also examine the existence of nonlinear eigenvalues and eigenvectors as well as the surjectivity of quasibounded operators finally some approximate fixed point theorems for multivalued mappings defined on banach spaces weak and strong topologies play a role here and both bounded and unbounded regions are considered the authors explicate a method developed to indicate how to use approximate fixed point theorems to prove the existence of approximate nash equilibria for non cooperative games fixed point theory is a powerful and fruitful tool in modern mathematics and may be considered as a core subject in nonlinear analysis in the last 50 years fixed point theory has been a flourishing area of research as such the monograph begins with an overview of these developments before gravitating towards topics selected to reflect the particular interests of the authors

with the inclusion of applications of singular value decomposition svd and principal component analysis pca to image compression and data analysis this edition provides a strong foundation of linear algebra needed for a higher study in signal processing the use of matlab in the study of linear algebra for a variety of computational purposes and the programmes provided in this text are the most attractive features of this book which strikingly distinguishes it from the existing linear algebra books needed as pre requisites for

the study of engineering subjects this book is highly suitable for undergraduate as well as postgraduate students of mathematics statistics and all engineering disciplines the book will also be useful to ph d students for relevant mathematical resources new to this edition the third edition of this book includes simultaneous diagonalization of two diagonalizable matrices comprehensive exposition of svd with applications in shear analysis in engineering polar decomposition of a matrix numerical experimentation with a colour and a black and white image compression using matlab pca methods of data analysis and image compression with a list of matlab codes
